

IN THE SPECIFICATION

Please amend the specification as follows:

Page 98, lines 2-24. Delete the original abstract, all of lines 2-14 and replace with the following:

A gaming system simulates events in a casino table card wagering game where there has traditionally been a dealer, whether or not the dealer is an active player in the game. Two distinct video areas are preferably provided, one providing video images of a virtual dealer, and the second video display providing a simulation of a table top for player cards, and optionally also dealer cards. The players have individual play areas with player input, and these play areas have individual processing intelligence that communicates directly with at least one processor. Delivery order of cards is determined by actual shuffling or randomization of a physical deck of cards, reading the cards, then creating an electronic file of the order of the shuffled or randomized cards, then using an order of cards contained in the electronic file to deliver virtual cards to players, dealer and flop as needed.

Page 32, lines 8-26:

Figure 1 shows a fully automated gaming table 1 of the prior art, as disclosed in US Patent Application 2003/0199316. The system 1 comprises a vertical upright display cabinet 2 and a player bank or station cluster arrangement 3. The vertical display cabinet 2 has a viewing screen 7 with a top section 4 on which images of the virtual dealer are displayed. The top 8 of the player bank arrangement 3 has individual monitor screens 10 for each player position, as well and tabletop inserted coin acceptors 11, and player controls 12 and 13. The motherboard 6 is shown underneath the top 8 of the player bank arrangement 3. There is a separate and larger dealer's hand screen 9 on which dealer cards are displayed in a format large enough for all players to view. Speakers 16a and 16b are provided for sound transmission and decorative lights 14 are provided. Figure 2 shows an overhead view of the same prior art automated gaming system 1 with the viewing screen 7 shown more clearly as a CRT monitor. It can also be seen that each player position has to form an arc cut into the semicircular player seating area

18. Figure 3 shows a side view of the same prior art automated gaming system of Figures 1 and 2 where the orientation of the three different types of CRT monitors 7, 9 and 10 are shown. The housing 5 and motherboard 6 in the Prior Art (US Publication 20030199316) are shown.

Figure 4 shows the schematic circuitry of a prior art automated system as disclosed in 2003/0199316. Figure 4 is a block diagram of processing circuitry in the game device of Figure 1. The game device housing comprises a CPU block 20 for controlling the whole device, a [[picture]] video block 21 for controlling the game screen display, a sound block 22 for producing effect sounds and the like, and a subsystem 21A for reading out CD-ROM.

Page 33, lines 3-6:

The RAM 202 is used as the work area for the main CPU 201. The RAM 203 stores the initialization program used for the initialization process. The SCU 200 controls the busses 205, 206 and 207 so that data can be exchanged smoothly among the VDPs [[VEPs]] 220 and 230, the DSP 241, and other components.

Page 34, line 27 – page 35, line 20:

The sound block 22 comprises a DSP 240 for performing sound synthesis using PCM format or FM format, and a CPU 241 for controlling the DSP 240. Sound data generated by the DSP 240 is converted into 2-channel sound signals by a D/A converter 270 and is then presented to audio output terminals Ao via interface 271. These audio output terminals Ao are connected to the input terminals of an audio amplification circuit. Thus, the sound signals presented to the audio output terminals Ao are input to the audio amplification circuit (not shown). Sound signals amplified by the audio amplification circuit drive the speakers 16a and 16b. The subsystem 23 comprises a CD-ROM drive 19b, a [[CD-I/F]] CD-I/O (CD input/output) 280, and CPU 281, an MPEG-AUDIO section 282, and an MPEG-PICTURE section 283. The subsystem 23 has the function of reading application software provided in the form of a CD-ROM and reproducing the animation. The CD-ROM drive 19b reads out data from CD-ROM. The CPU 281 controls the CD-ROM drive 19b and performs error correction on the data read out by it. Data read from the CD-ROM is sent via the CD-I/F 280, bus 206, and SCU 200 to the main CPU 201 that uses it as the application software. The MPEG-AUDIO

Figure 7 shows the electronic/processing schematics of the MPP Player Station 400 Intelligence board (Heber Pluto 5 Casino, Motorola 68340), each of which player stations (one for each player position) are in direct connection to the MPP Game Engine (Dealer), which is in turn directly connected to the PC Platform. (not shown in this Figure). Each Intelligence board 300 receives information for all player input systems specific to that player station, such as the shown Coin Acceptor 310, Coin Hopper 312, Bill Validator 314, Ticket Printer 316, Touch Screen 317 and/or Display Button Panel 318, Dual Wire Ticket-in-Ticket-out Printing and SAs System 320 (SAs is one exemplary standard communications protocol used by a

Page 36, lines 18-26:

Figure 6 shows an electronic/processor schematic for a MultiPlayer Platform (MPP) gaming system according to the present invention. The MPP Game engine (dealer) comprises a Heber Pluto 5 casino game board 290 (Motorola 68340 board) operating off the PC Platform Pentium 4 MPP Game Display processor 292 [202]. The game display processor operates on a Windows XP platform. The respective subcomponents on the Pentium 4 processor are labeled to show the appportionment of activity on the motherboard and the component parts added to the board. As is shown, the game engine has an Uninterruptible Power Supply 294 [204]. The game display processor directs activity on the Speakers, directs activities onto the MPP Game Service panel, and the Plasma Monitor Card Table display. It is important to note that all communications are direct from the game display processor, freeing up resources available to the game engine processor.

Page 36, lines 1-12:

Section 282 and the MPEG-PICTURE section 283 are used to expand data that has been compressed in MPEG (Motion Picture Expert Group) format. By using the MPEG-AUDIO section 282 and the MPEG-PICTURE section 283 to expand data that has been compressed in MPEG format, it is possible to reproduce motion picture. It should be noted herein that there are distinct processor for the CPU block, video block, sound block, CD-ROM drive and memory with their independent PCU's. This requires significant computing power and still has dumb (no intelligence) player input components.

platform 156 or the top of the platform itself is level with the sensors 152. This information is at a specific elevation. The sensing devices 152 identify when an uppermost card on the elevator that positions the top card in a set of cards (not shown) within the card mixing area 150. For example, a set of sensing devices 152 are used to determine the movement point of the apparatus 112. The microprocessor also receives and responds to information provided to it. The microprocessor (not shown) controls and directs the operation of the shuffling apparatus 112.

Page 68, lines 8-20:

useful to the operator or casino. number of decks being shuffled, card calibration information and the like), or other information players, the number of cards per hand, access to fixed programming for various games, the deck(s), damaged or marked cards, entry functions for the dealer to identify the number of cycle, insufficient numbers of cards, missing cards, sufficient numbers of cards, complete displays 24h and 26h. These elements on the top surface 4h of the shuffling device 2h may act monitor, semiconductor display, etc.), and a series of buttons 28h 30h, touch pads, lights and/or shuffling apparatus 2h is provided with a visual display 12h (e.g., LED, liquid crystal, micro place or remove cards into the card accepting/receiving area 6h. The top surface 4h of the depression 10h is provided in that nearest outer side 9h to facilitate an operator's ability to that slopes downwardly from the nearest outer side 9h of the shuffling apparatus 2h. A accepting/receiving area 6h that is preferably provided with a stationary lower support surface device randomizes one or two decks of cards. The shuffling apparatus has a card apparatus 2h according to a practice of the invention. In this example of the invention, the figure 9 shows a partial perspective view of the top surface 4h of a first shuffling

Page 64, lines 13-29:

systems were constructed. the MP Game Engine 300, as opposed to each individual player position button panel being dead or inactive until authorized by the main game processor, as previous automated gaming independent Intelligence boards 305 at each player position being in direct communication with number of casinos central computer systems). A significant benefit resides in the use of the

cover **S02** when the elevator platform **S12** rises to a level where cards are to be removed, the **S13** of the flip-up cover **S02**, here with a roller **S15** shown as the contact element, to lift the invention, there is provided an arm extension **S14** of the elevator that contacts an internal edge ready player opening of the shuffling apparatus **S00**. In a preferred embodiment of the additional space may be designed to accommodate only a tool so as to reduce any possibility of for a finger or tool to be inserted against the extension **S07** to assist in its lifting. That lifting of the flip-up cover **S02** when needed. The open area **S08** leaves some additional space insertion area **S10**. An extension or tab **S07** is provided to nest into open area **S08** to assist overally the elevator platform **S12** and the card insertion area **S10** with an edge **S22** to the card invention. That apparatus **S00** is shown with a flip-up cover **S02** with sections **S04** and **S06** that Figure 14 shows a vertical perspective view of another apparatus **S00** according to the

Page 77, lines 1-16:

which is shown also in Figure 4. This is a particularly desirable aspect of a preferred practice of the present invention, provided. Rollers, fluid movement of the card, reduced damage of the card, and reduced jamming may be both sides of the card at a single position, and by selecting offset rollers rather than aligned nip precisely laterally oriented. By selecting a nip width that is not so tight as to press a card from rollers, so that rollers **142a** [[and (not shown)], **144a** and **146a** and **146b** are not **146** of a first example of the invention. These are not truly sets of nip rollers, but are off-set Figure 11 shows a perspective cutaway of the drive rollers or nip rollers **142**, **144** and rollers, so that rollers **142a** [[and (not shown)], **144a** and **146a** and **146b** are not

Page 72, lines 9-16:

the system. As later explained to randomly arrange and thus shuffle cards according to the programming of cards present on the platform **156** [[**150**]] at any given time is known. This information, such as the number of cards present within the card mixing area **150**, is used by the microprocessor, area **116** into the card mixing area **150** so that the number of cards shuffled and the number of cards present, such as the number of cards that have been fed from the card accepting/receiving information, such as the number of cards that have been fed from the card accepting/receiving provided to the microprocessor. A reading system **170** may also be used to provide

positioned and available to be inserted by insert rollers 912. 938 and 926 may also act to assure that a card to be fed into the elevator 930 is properly jamming, clearance, alignment, in-feed availability (into the elevator area 930. The sensors 916. A set of sensors 922 and 926 operate as card position sensors to check for card set area 902. Sensor 928 is in a more favorable card sensing position to act as a trigger for the camera 904. Sensor 920 is a card set sensor 920 that indicates that there are still cards in the initial card set area 906 within the initial card set receiving area 902 with sensors 940. Sensor 920 is 904 and 906 within the initial card set receiving area 902 with sensors 940. Sensor 920 is 916 therein. The various elements are shown in a different view, such as the pick off rollers shown in Figure 9 as a card set sensor 920 that indicates that there are still cards in the initial card set area 900 with card reading camera 904.

Page 88, lines 18-26:

An additional design improvement with respect to the apparatus of Figure 10 [9-and that of Figures 14 and 15] is the elimination of a staging area in the apparatus design of Figure 9. After a card (not shown) in Figure 10 [9] passes from rollers 140 to rollers 144, but before being passed to rollers 146, the card would be held or staged by rollers 144. This can be eliminated by the design of rollers shown in Figures 14 and 15, with the movement of the cards timed to the movement of the elevator platform and the separation of the cards by the pickers.

Page 80, lines 14-20:

the invention, side panels are not used to stabilize the stack of delivered cards. They are lifted from the elevator platform 512, although additional elements (not shown) may be used to restrain movement of the cards when elevated to a removal level. In this example of extension 514 forces the cover 502 to lift from the top 517 of the apparatus 500 having a front edge 532, and back edge 530. The extension 514 also will buffer playing cards from moving as they are lifted from the elevator platform 512, although additional elements (not shown) may be used to restrain movement of the cards when elevated to a removal level. In this example of extension 514 forces the cover 502 to lift from the top 517 of the apparatus 500 having a front
